Yellowfin Model Development

First Model Runs and Ideas to Explore

Arni Magnusson

SPC PAW Meeting
27 March 2026, Nouméa

Model development

Spatial structure

1. Consider single-region or equatorial model
2. Revise regional structure (esp. bigeye)

Fisheries

3. Convert weight comps to length comps
4. Combine fisheries
5. Lower effective sample size in general
6. Analyze data conflict, identify and test different approaches
7. Possibly reduce sample size in regions without otolith data
8. Consider different scenarios for Indonesian catches
9. Consider using size composition from predominant nation in some fisheries

Natural mortality

10. Fix at different levels of M

Movement

11. SEAPODYM coefficients

Growth

12. Reweight otoliths based on location
13. Richards curve

Selectivity

14. Length-based

Tags

15. Mixing period for each release group

CPUE

16. Alternative indices
17. Time-varying CV
18. Effort creep
